

**Cinder Block - Foundations**  
**Level of Difficulty: Simple**

Structurally a very strong foundation option, cinder blocks are another easy way to level your garden shed floor. They can be purchased from your local building supplier and may be used to level a shed on a moderately steep slope.

**A Word about Cinder Blocks**

- Cinder blocks are not included in your kit.

*Cinder blocks may be used if the ground slopes considerably*

**Cinder Blocks & Your Garden Shed**

Here's what you need to know when laying the foundation for your Todd's Garden shed floor using cinder blocks:

- Cinder blocks generally have dimensions of 8" x 16". While they provide uncompromising strength, their size and weight may cause your garden shed to sink if the ground below it is soft. Use multiples of cinder blocks and overlapping rows to guard against any sinking.

*typical cinder block*

**What We Recommend**

When using cinder blocks for your shed foundation, we suggest the following (depending on the size of your structure, the recommendations below may be adjusted accordingly):

- Attach a skirt to your garden shed to hide the cinder block foundation. We provide one row of skirting which you can use to cover the foundation underneath. Skirting can also help to keep pesky critters out from the bottom of your shed. If you'd like more rows of skirting (because your structure is elevated), they can be purchased when you place your order.
